

During the time of developing the Lunar Rover an interesting thing happened with a couple astronauts, Dave Scott and James Irwin. They had checked the Rover previously and had asked for a couple changes. One was a part to be moved up & out and one was tape that would be hard for them to reach while in their space suits. When checking again the changes had not be made. Dave Scott was not happy. He sat in the seat put his feet on what was to be ~~be~~ moved and pushed. It broke and he said now fix it like I asked. He asked for scissors and cut the tape that was to be fixed and said to fix it right. Of course it was fixed.

I was sent to Kennedy Space Center to help write procedures for local engineers to handle the Lunar Rover. I worked with an engineer named Dave Bast. We worked until 9:15 when Grumman engineers loaded the Rover on their equipment that would be attached to the Lunar Excursion Module.

I was fortunate when a Grumman engineer asked if I would like to see the inside of the Lunar Excursion Module. We climbed the ladder on the outside and crawled inside. It was very tight and only had room for the two astronauts.

While I was down at Kennedy Space center with the Lunar Rover I realized it was the completion of Boeing and my work on the Rover. It had been an exciting experience to be involved in.

I actually thought about putting my initials on it but decided not too. Later I found out someone had and had lost their job. So glad I didn't.
